Strengthening organisations by looking after your people, assets and operations globally.

AssetMonitor

AssetMonitor is a comprehensive yet easy-to-use risk management system that provides 24/7 security monitoring and incident response for all of your assets: offices, plants, warehouses, compounds, supply chains and any other static or mobile assets.

What is *AssetMonitor*?

AssetMonitor lets you plot your assets on our global risk map, identify potential risks and respond to potentially impactful incidents - all from a single screen. You also have the ability to store documents against each of your assets, e.g. disaster recovery plans, risk assessments etc.

We use thousands of sources to continually monitor the globe for incidents. This enables our dedicated team of analysts and risk experts to provide real-time alerts and intelligence that can help you to stay ahead of potential threats to your facilities and maintain operational continuity.

Benefits of *AssetMonitor*

Manage everything from one screen
Monitor your global assets, identify and respond to incidents, get real-time alerts and launch two-way communications with key asset stakeholders if the situation requires it. AssetMonitor gives you the capability to monitor and manage a crisis from a single, centralised platform for maximum convenience.

Custom profiles for each asset
Create comprehensive profiles for each one of your assets and preemptively respond to any incident that might occur. With the key details for every asset in one central location, you'll save valuable time when responding to any incidents that occur.

Improve your response with real-time, two-way communications
AssetMonitor's in-built two-way communications let you contact assets directly in order to respond to an incident. Stakeholders can also keep each other updated on the incident and actions taken directly within the AssetMonitor platform. This can improve your response rate to incidents and improve transparency between global facilities.
